

I would like to know if granite is a delicate stone that can be chipped easily?

Q. I would like to know if granite is a delicate stone that can be chipped easily?

A. Granite is not delicate. In fact it is one of the hardest minerals. However, it is made up of several minerals that are glued together through natural processes. Because of this, if hit hard enough with a hard object it could chip because of its brittleness. Small repairs of this type are not a problem for a stone and tile restoration professional trained in crack and chip repair. If you don't yet have a PRO, [contact us](#).
