

# How much weight is required to hone and polish granite?

Depending on which machine you use the more weight the better. If you are using a single disc machine use at least 75 pounds. It is important that your machine operate properly with the added weight. For this reason make sure you operate at least a 1 ½ horsepower motor. If you are using a planetary head machine, the same rule applies, lots of weight. If an Italian grinder is used no weight is required.

***TIP Make sure to use diamonds designed for granite work. Marble diamonds may wear out faster.***
