

My honed black granite looks streaky, (from sealer application). How do I remove the sealer or do I need to re-sand the stone?

Q. My honed black granite looks streaky, (from sealer application). How do I remove the sealer or do I need to re-sand the stone?

A. You may have to call in a stone restoration professional on this. But first try this: Pour some acetone (the kind you get in a hardware store, not fingernail polish remover) on a white rag and try wiping it down. If that does not work for you try something a little stronger, like furniture stripper (with MEK). Don't go right to the MEK first, it is harsh stuff. Be sure to use all safety precautions. See our free, downloadable [Stone and Tile Care Guide](#) for more information.

If you do need to bring in a stone restoration contractor and you do not have one, [contact us](#).
