

We live in San Francisco and are refurbishing our town house. We would like to use marble on our kitchen floor, but are concerned it may crack during an earthquake. Is there any way to install it that would minimize the cracking?

There are several fracture membranes that can be installed to help minimize cracking. These membranes are rubber or plastic-based and are designed to absorb some shock. However, you will not totally eliminate cracking if the tremor is severe. Consult with your stone supplier or setting mechanic for further information and recommendations.
